

JavaScript: Functions and Events

Go to the dropbox titled JavaScript: Functions and events.

Open the attached zip folder, extract it, and save the html, javascript, and css files in a location on your computer. Look at the code.

When opening the html file it should look like this:

The screenshot shows a web form with the title "Calculate Average" in blue text. Below the title are three input fields: "Exam1:" with a white text box, "Exam2:" with a white text box, and "Average Grade" with a light gray text box. Below these fields is a button labeled "Calculate Average".

You can enter two numbers in the textbox and press “calculate average” and the average gets entered into the third textbox.

Create your own code with textboxes to do any one of the following:

1. Your madlib – ask the user to enter the nouns, verbs, numbers, etc. in the textboxes and display the answer on the screen when the user clicks the button.
2. Some other type of mathematical problem that’s not find average above
3. Anything else of your choosing using functions and events...have fun!!

Submission: Zip your code and submit to the dropbox. (Note: You must submit a zip file and not the individual files for me to be able to grade it.)
