CSS Basics –Text and Font

HTML File:

1. Bring up your index.html file that we created for our homepage in our last assignment in replit.com.
2. Make sure you are using at least 2 paragraphs with paragraph tags (<p>). If not add them.

CSS File:
Hint: You can use our CSS cheatsheet for different text and font options:
http://rachelfadler.com/cs412/cssCheatSheet.html

3. Go to the file named style.css in replit.com.
4. Have your heading (h1, h2, whichever you used):
   a. Appear in a color of your choice
   b. Be centered on the page (text-align: center;)
   c. In the font family of your choice
5. Specify a font family and font size for the paragraph tag.
6. Go back to the index.html page and add an id to one of the paragraphs.

For example, let's say I wanted a paragraph that serves as an alert on a page. I do not want it to look like all the other paragraphs on the page, but I want it to stand out so people are sure to notice it. I could add **id="alert"** to that paragraph, like this: (p.s. No, classes are not cancelled!)

```
<p id="alert">Important! All classes are cancelled today! </p>
```

7. In the CSS file, specify the changes you would like for this specific paragraph (perhaps a different font-family, size, color, etc.)
8. Add BOTH a span and div tag somewhere in the html file and set the property in css.
9. Add the same class attribute to at least two tags, and set its css properties.

10. Note – for this assignment you may not have any inline css or css in your style tags in your index.html page – I want to see all css in the separate file.

Submission: No need to submit anything – I already have your URL from the first assignment. If I don't have your URL then email me your URL.
