Cascading Style Sheets (CSS)

- Although HTML provides some capabilities for controlling a document's presentation, *it's better not to mix presentation with content.*
- **Cascading Style Sheets (CSS)** are used to specify the *presentation*, or styling, of elements on a web page (e.g., fonts, spacing, sizes, colors, positioning).
- By separating page styling from page content and structure, you can easily change the look and feel of the pages on an *entire* website, or a portion of a website, simply by swapping out one style sheet for another.

CSS

- Document that contains a set of rules on how to present another document
- A CSS document consists of one or more **style rules**

We will do this!

Three ways to provide styles

***Use an external style sheet**

```
<link rel="stylesheet" href="styles/main.css">
```

Embed the styles in the head section

```
<style>
  body {
    font-family: Arial, Helvetica, sans-serif;
    font-size: 87.5%; }
  h1 { font-size: 250%; }
</style>
```

Use the style attribute to apply styles to a single element

```
<h1 style="font-size: 500%; color: red;">
  Valley Town Hall</h1>
```

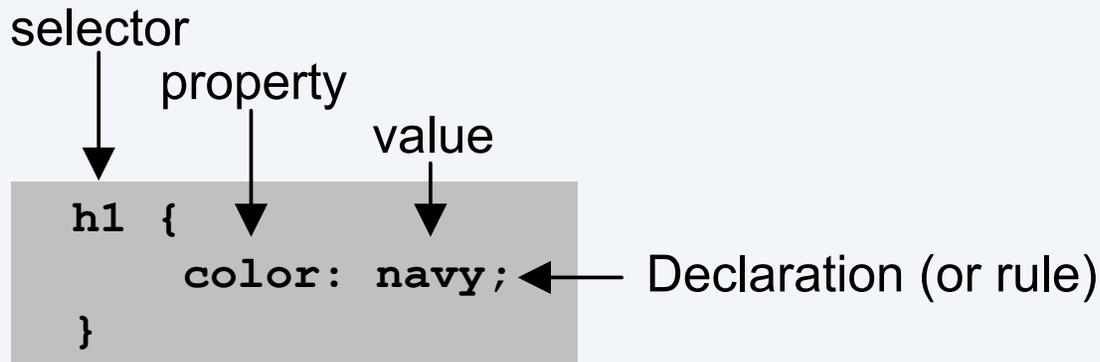

***We will be doing it the first way.**

The link element for a style sheet

```
<link rel="stylesheet" href="book.css" >
```

Put in HTML page

The parts of a CSS rule set

Selector: identify an HTML element

Property: identify a display feature to specify

Value: the value of the display property

- can be more than one

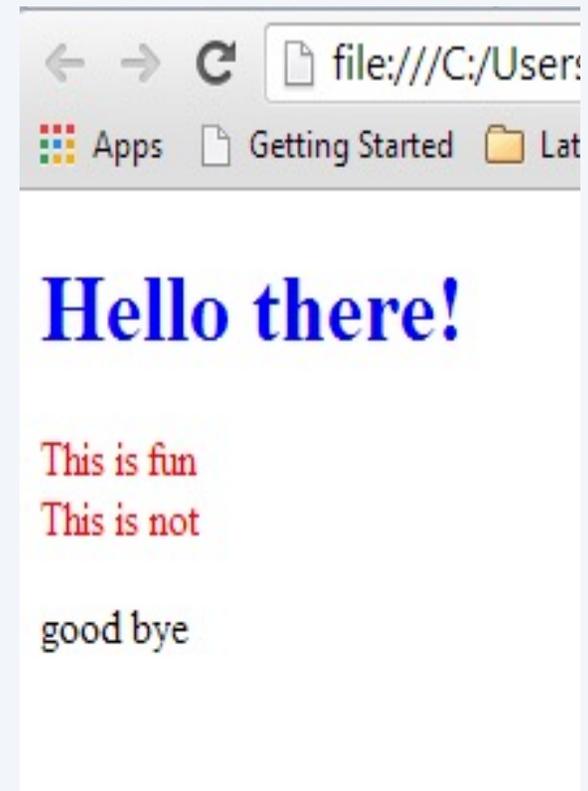

e.g., `border: 2px solid black;`

HTML File

```
<!DOCTYPE html>
<html>
  <!-- Example using tags, new lines, css, colors-->
  <head>
    <meta charset="utf-8">
    <title>Just a test</title>
    <link rel="stylesheet" href="source.css">
  </head>
  <body>
    <h1>Hello there!</h1>
    <p>
      This is fun
    <br>
    This is not
    </p>
    good bye
  </body>
</html>
```

CSS File

```
h1 {
    color:blue;
}
p {
    color:red;
}
```

HTML Block Elements vs. Inline Elements

Block level elements normally start (and end) with a new line when displayed in a browser.

Examples: `<h1>`, `<p>`, ``, `<table>`

Inline elements are normally displayed without starting a new line.

Examples: ``, `<a>`, ``

The HTML `<div>` and `` Elements

The HTML `<div>` element is a block level element that can be used as a container for grouping other HTML elements.

The HTML `` element is an inline element that can be used as a container for text.

The `<div>` and `` elements have no special meaning. Use when the HTML5 semantic elements don't apply.

When used with CSS, the `<div>` element can set style attributes to large blocks of content and the `` element can set style attributes to parts of the text.

Try it.

Common units of measure

Symbol	Name	Type	Description
px	pixel	absolute	A single dot on a monitor. The number of dots per inch depends on the resolution of the monitor.
pt	point	absolute	A point is 1/72 of an inch.
em	ems	relative	One em is equal to the font size for the current font.
%	percent	relative	A percent specifies a value relative to the current value.

font-size: 12pt; /* in points */
font-size: 150%; /* as a percent of the parent element */
font-size: 1.5em; /* same as 150% */

How to specify a font family

Font family

If the browser does not support the first font it tries the next font.

font-family: Arial, Helvetica, sans-serif;

font-family: "Times New Roman", Times, serif;

font-family: "Courier New", Courier, monospace;

Selectors

- What if you don't want all h1 tags to be displayed the same?
- Three ways to select elements:
 - **element Selectors**: e.g., <p>
 - applies to **all** elements of that type
 - **Id Selectors**: **unique** label assigned to an element
 - prefix CSS rule with #
 - **Class Selectors**: label assigned to multiple elements
 - prefix CSS rule with . (a period)

Class Selectors

A **class selector** allows you to simultaneously target different HTML elements.

```
<h1 class="first">Reviews</h1>
<div>
  <p class="first">By Ricardo on <time>September 15, 2015</time></p>
  <p>Easy on the HDR buddy.</p>
</div>
<hr/>

<div>
  <p class="first">By Susan on <time>October 1, 2015</time></p>
  <p>I love Central Park.</p>
</div>
```

```
.first {
  font-style: italic;
  color: red;
}
```

Id Selectors

An **id selector** allows you to target a specific element by its id attribute regardless of its type.

```
<body>
  <h1>Reviews</h1>
  <div id="latestComment">
    <p>By Ricardo on <time>September 15, 2015</time></p>
    <p>Easy on the HDR buddy.</p>
  </div>
  <hr/>
  <div>
    <p>By Susan on <time>October 1, 2015</time></p>
    <p>I love Central Park.</p>
  </div>
```

```
#latestComment {
  font-style: italic;
  color: red;
}
```

Example

```
<h1 class="boringtext">boring text about yada yada yada</h1>
<p class="boringtext">Let's learning more about blah blah blah</p>
<p>This paragraph is not affected by the style.</p>
<p id="unique">I am unique and interesting!</p>
<p class="boringtext">Let's keep discussing blah blah</p>
```

```
#unique{
    text-align:center;
    color:red;
    font-size: 150%;
}
.boringtext{
    color:blue;
}
```

boring text about yada yada yada

Let's learning more about blah blah blah

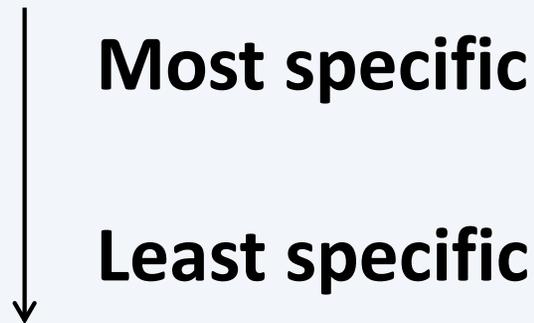

This paragraph is not affected by the style.

Let's keep discussing blah blah

I am unique and interesting!

When rules collide...

- What happens if one element has more than one applicable CSS rule?
- Apply **most specific** rule
 - **Id** is most specific
 - **Class** is less specific
 - **Element** is least specific
- Use the rule set with the highest specificity.
- If the specificity is the same for two or more rule sets in a group, use the rule set that's specified last.

When rules collide...example:

```
body {  
    font-family: Arial, Helvetica, sans-serif;  
    font-size: 87.5%; }
```

A rule that overrides the inherited font family

```
p { font-family: "Times New Roman", Times, serif; }
```

```

body {
  font-weight: bold;
  color: red;
}

div {
  font-weight: normal;
  color: magenta;
}

p {
  color: green;
}

.last {
  color: blue;
}

#verylast {
  color: orange;
  font-size: 16pt;
}

```

```

<body>
  This text is not within a p element.
  <p>Reviews</p>
  <div>
    <p>By Ricardo on <time>September 15, 2015</time></p>
    <p>Easy on the HDR buddy.</p>
    This text is not within a p element.
  </div>
  <hr/>
  <div>
    <p>By Susan on <time>October 1, 2015</time></p>
    <p>I love Central Park.</p>
  </div>
  <hr/>
  <div>
    <p class="last">By Dave on <time>October 15, 2015</time></p>
    <p class="last" id="verylast">Thanks for posting.</p>
  </div>
  <hr/>
</body>

```

← → 🔍 Figure08-12.html

This text is not within a p element.

Reviews

By Ricardo on September 15, 2015

Easy on the HDR buddy.

This text is not within a p element.

By Susan on October 1, 2015

I love Central Park.

By Dave on October 15, 2015

Thanks for posting.

Location

- When rules have the same specificity, then the latest are given more weight.
- For instance, an inline style will override one defined in an external author style sheet or an embedded style sheet.

A head element that includes two style sheets

```
<head>  
  <title>San Joaquin Valley Town Hall</title>  
  <link rel="stylesheet" href="../styles/main.css">  
  <link rel="stylesheet" href="../styles/speaker.css">  
</head>
```

The sequence in which styles are applied

- From the first external style sheet to the last

Combinations of selectors

A selector for a class within an element

```
ul.speakers { list-style-type: square; }
```

Multiple selectors

```
h1, h2, h3 { color: blue; }
```

```
p, ul.speakers li {  
    font-family: "Times New Roman", serif; }
```

Relational Selector

- How to express: “Make all links in unordered lists have the color green”?
- **ul a { color: green; }**

Universal Selector

You can select all elements by using the **universal element selector**, which is the * (asterisk) character

HTML that can be selected by element type, id, or class

```
<main>
  <h1>This Season's Speaker Lineup</h1>
  <p class="blue">October: Jeffrey Toobin</p>
  <p class="blue">November: Andrew Ross
Sorkin</p>
</main>
<footer>
  <p id="copyright" class="blue right">Copyright
  2018</p>
</footer>
```

This Season's Speaker Lineup

October: Jeffrey Toobin

November: Andrew Ross Sorkin

Copyright 2018

All elements

```
* { margin: .5em 1em; }
```

Elements by type

```
main {
  border: 2px solid black;
  padding: 1em; }
h1 { font-family: Arial, sans-serif; }
p { margin-left: 3em; }
```

One element by ID

```
#copyright { font-size: 80%; }
```

Elements by class

```
.blue { color: blue; }
.right { text-align: right; }
```

CSS rule sets by type, id, and class

Type

```
body {  
  font-family: Arial, sans-serif;  
}
```

ID

```
#main {  
  width: 300px;  
  padding: 1em;  
}  
#copyright {  
  font-size: 75%;  
  text-align: right;  
}
```

Class

```
.base_color {  
  color: blue;  
}
```

CSS rule sets with relational selectors

Descendant

```
#main li { font-size: 14pt; }  
ul a { color: green; }
```

Adjacent sibling

```
h2+p { margin-top: .5em; }
```

Child

```
#main>p { font-size: 11pt; }  
li>a { color: green; }
```

General sibling

```
h2~p { margin-left: 2em; }
```

How to use the W3C CSS Validation Service

- Go to the URL that follows, identify the file to be validated, and click the Check button:

`http://jigsaw.w3.org/css-validator/`
